Lab 3: Inputs & Outputs: Receipt Builder

Python Lab · Section 1.2 Program Function & Purpose

Goal

Build a receipt program, then describe its purpose, function, inputs, and outputs like the Create Task.

Warm-up: Predict

```
price = 4.50
qty = 3
total = price * qty
print("Total:", total)
```

Predict the output. Identify each input/output in this code.

AP Connection

- Purpose = why the program exists; function = what it does (1.2).
- The program waits for the user to press Enter — an event that supplies input.

Build It

Step 1. Ask for the names and prices of three items.

```
item1 = input("Item 1 name: ")
price1 = float(input("Item 1 price: "))
# repeat for items 2 and 3
```

Step 2. Calculate the subtotal, an 8% tax, and the total.

```
subtotal = price1 + price2 + price3
tax = subtotal * 0.08
total = subtotal + tax
```

Step 3. Print a neat receipt. `round(x, 2)` rounds to 2 decimal places.

```
print("----- RECEIPT -----")
print(item1, "$" + str(price1))
# ...
print("Total: $" + str(round(total, 2)))
```

Step 4. Write a comment at the top describing the program's PURPOSE and FUNCTION in one sentence each.

```
# Purpose: ...
# Function: ...
```

Date:

Build It (continued) · Level Up

Write: "When the user _____, the program _____." for your receipt program.
