

Unit 1.1 Collaboration

The Big Picture

For the AP CSP exam, Unit 1.1 Collaborating is actually pretty small. You do NOT need to memorize a giant list of CS vocabulary. Instead, we'll focus on the key ideas below.

Collaboration

Know that computing is often done collaboratively, and people can contribute different:

- skills
- ideas
- experiences

Key Vocabulary

Collaboration

working with others towards a common goal

Computing innovation

an innovation that included a computer or computer-related component

Computing

the use of computational processes to solve

Perspective

a person's particular way of _____ or understanding a problem

Innovation

a new or improved idea, product, or process

Computing innovations are often created by teams

Be able to recognize that collaboration can help people:

- solve problems
- developing computing innovations
- improve solutions

Different perspectives matter

The exam can give you a scenario where a team is designing a computing solution and ask about the benefits of having people with different backgrounds/perspectives.

Think:

More perspectives → more possible ideas/solutions → potentially better solution.

You Try!

A group of students is developing a mobile app designed to help students at their school find clubs that interest them. The team included students from different grade levels and backgrounds.

Explain how having these students *collaborate* together could benefit the development of the app.
