Lab 1: Hello, Python!

Python Lab · Section 1.1 Collaboration (course launch)

Goal

Write and run your first Python programs using `print()`, strings, and comments.

Warm-up: Predict

```
print("Hello")
print("AP", "CSP")
# print("Hidden")
print("Done!")
```

Predict the output before you run it. Which line doesn't print anything? Why?

AP Connection

- `DISPLAY(expression)` in AP pseudocode is like `print()` in Python.
- Comments (`# ...`) are documentation that doesn't run (1.3).

Build It

Step 1. Open your Python editor. Type and run your first program:

```
print("Hello, world!")
```

Step 2. Print three lines about yourself: your name, a hobby, and something you want to build with code.

```
print("My name is ...")
print("I like ...")
print("Someday I want to build ...")
```

Step 3. Strings can be joined with `+` (concatenation, Topic 3.4). Notice you must add your own spaces:

```
print("AP" + "CSP")
print("AP" + " " + "CSP")
```

Step 4. Add a comment above each line explaining what it does. Comments start with `#`.

```
# Greet the user
print("Welcome to AP CSP!")
```

Step 5. Make an error on purpose: delete one quotation mark and run it. Read the error message. What type of error is it?
